Acknowledgments

I would like to thank the staff of the Colorado Oil & Gas Conservation Commission (C.O.G.C.C.) who provided considerable assistance during the course of this compilation, and the staff of the Colorado Geological Survey, who assisted in the manuscript preparation.

However, I assume full responsibility for any errors or omissions in these tabulations. Users of this OPEN-FILE REPORT could provide a significant service if they would inform the Colorado Geological Survey of any misinformation or omissions.

This project was completed by the staff of the Colorado Geological Survey as part of a grant from the Department of Local Affairs - Division of Commerce and Development.

A. H. Scanlon
Senior Geologist

ESTIMATED OIL AND GAS RESERVES FOR YUMA COUNTY, COLORADO

Introduction

This report is the fourteenth* in a series of oil and gas reserve investigations undertaken for those counties in which oil and/or gas is currently being produced.

This study involves Yuma County, located in northeastern Colorado, near the eastern edge of the Denver Basin. Yuma County covers 2,383 square miles. In this county, gas and/or condensate are produced from the Niobrara limestone.

There are 21 fields considered active producers as of December 31, 1983. All of these are classified as gas fields (based on cumulative GOR >15:1).

- OPEN-FILE REPORT 84-15: Estimated Oil and Gas Reserves for Routt County, Colorado.

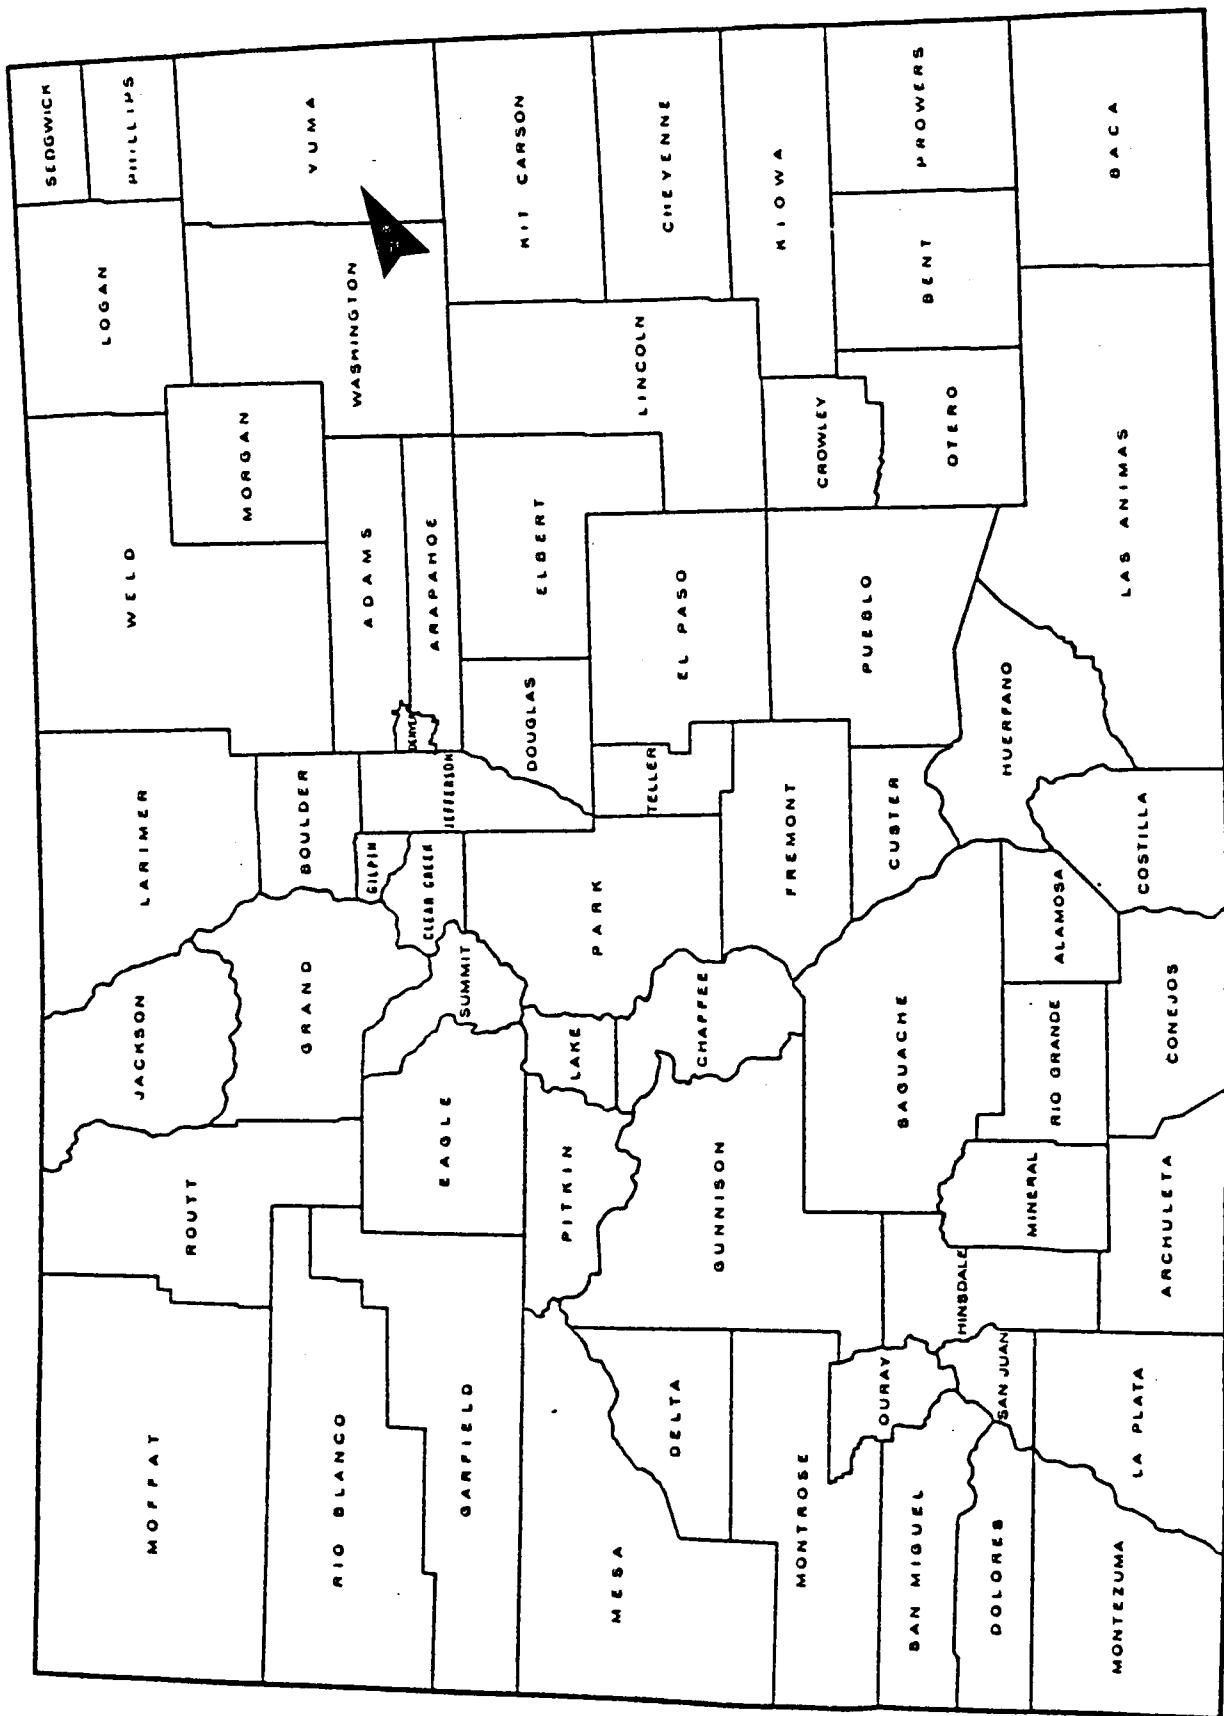

Figure 1. County Location Map

Method of Approach

Production decline curves are plotted for each currently producing horizon within each field, hereafter referred to as a field-horizon. There are 21 production decline curves plotted, one for each field-horizon. Production data were obtained from the C.O.G.C.C. annual production books. These books contain records of yearly production data, dating back to 1952. All production decline curves are plotted as rate (annual production in barrels of oil or MCF of gas) versus time (in years). The rate scale was adjusted to accommodate each field-horizon.

Gas Reserve Calculations

There are 21 gas field-horizons. Production histories have allowed for decline rates to be calculated for 8 of these. The remaining 13 gas field-horizons have not produced for a long enough time (less than 3 years) to determine reliable decline rates. Decline rates were determined for the 8 previously mentioned gas field-horizons (see Table I) and applied to the equation:

$$S = \frac{a(1-r^n)}{1-r}$$

Where: S = gas reserves

a = current annual gas production

r = (1-dy) where dy = annual decline rate

n = number of years -- 20 years was used
in all cases except where noted in
the remarks column of Table I.

Results can be found in Table I.

Results

The following figures are for those field-horizons for which reserves could be calculated. Estimated gas reserves for Yuma County totaled 11,080,846 MCF. Note that the gas reserve calculations are based on a 20-year projection, therefore they do not account for gas production after the year 2003.

These figures also do not account for production increases due to secondary and/or tertiary recovery not already in progress, or account for undiscovered reserves, nor do they reflect changes in economics or demand.

In Yuma County, roughly one half of the estimated gas reserves for the next 20-year period are expected to be produced in six to seven years.

In this county there are two classes of field-horizons: I) those with a long enough production history to calculate reserves with confidence, and II) those new field-horizons with essentially no production history, or for other reasons, reserves cannot be calculated.

To be able to calculate total county gas reserves, it was necessary to apply the overall decline rate (8.9 percent per year for gas) obtained from class I field-horizons to the current production from Class II field-horizons.

Using this approach on current production from Class II field-horizons (6,440,990 MCF of gas) additional reserves of 61,152,293 MCF of gas were obtained. This gives total county reserves (Class I and II) of 72,233,139 MCF of gas.

To insure that the reserve figures calculated for Class II are reasonable using this method, a comparison was made between the sources (producing horizons) of the Class I and Class II field-horizons. It was determined that there were no differences in the sources of production for the two groups. Therefore, it is concluded that the overall decline rates can be applied with confidence.

LIST OF ABBREVIATIONS USED IN TABLE OF RESERVE DATA

| | |
|-----------|--|
| 'a' | annual gas production |
| ABD. | abandoned |
| Approx. | approximate, approximately |
| Avg. | average, averaged |
| Bbls. | barrels |
| B.W.E. | Bottom Water Encroachment |
| calc. | calculate, calculated |
| Co.(s) | county (counties) |
| cond. | condensate |
| ck. | Creek |
| Cum. | cumulative |
| Dak. | Dakota Sandstone |
| Deplet. | Depletion |
| dy | annual decline rate |
| Econ. | Economic |
| Est. | Estimated |
| Exp. | Expansion |
| g | gas |
| Gas Exp. | Gas Expansion |
| G.C.E. | Gas Cap Expansion |
| G.E. | Gas Expansion |
| GOR | Gas-Oil Ratio |
| Inc. | Increase, increasing, increased |
| Inj. | Injection, injected |
| Lmtd. | Limited |
| MCF | Thousand cubic feet |
| Miss. | Mississippian |
| Mos. | Months |
| Mtn. | Mountain |
| N | North |
| N.P. | New Production or less than five years production, therefore, no reliable annual decline rate could be calculated to apply to the equations to calculate reserves. |
| No. | number, numbers, North |
| o | oil |
| P and A | Plug (ged) and Abandon (ed) |
| Poss. | Possible |
| Prod. | Production, produced |
| Proj. | Projection, projected |
| q | current annual production of oil |
| qf | final economic production of oil |
| react. | reactivated |
| Rr | Remaining reserves-oil |
| S | Remaining reserves-gas |
| S.G.D. | Solution Gas Drive |
| S.I.(SI) | Shut-in |
| So | South |
| W | West |
| W.D. | Water Drive |
| Yr or Yrs | Year or years |

Appendix I

Historical production decline curve graphs for Yuma County. These graphs are presented in alphabetical order by Field name and then by producing horizons within each field.

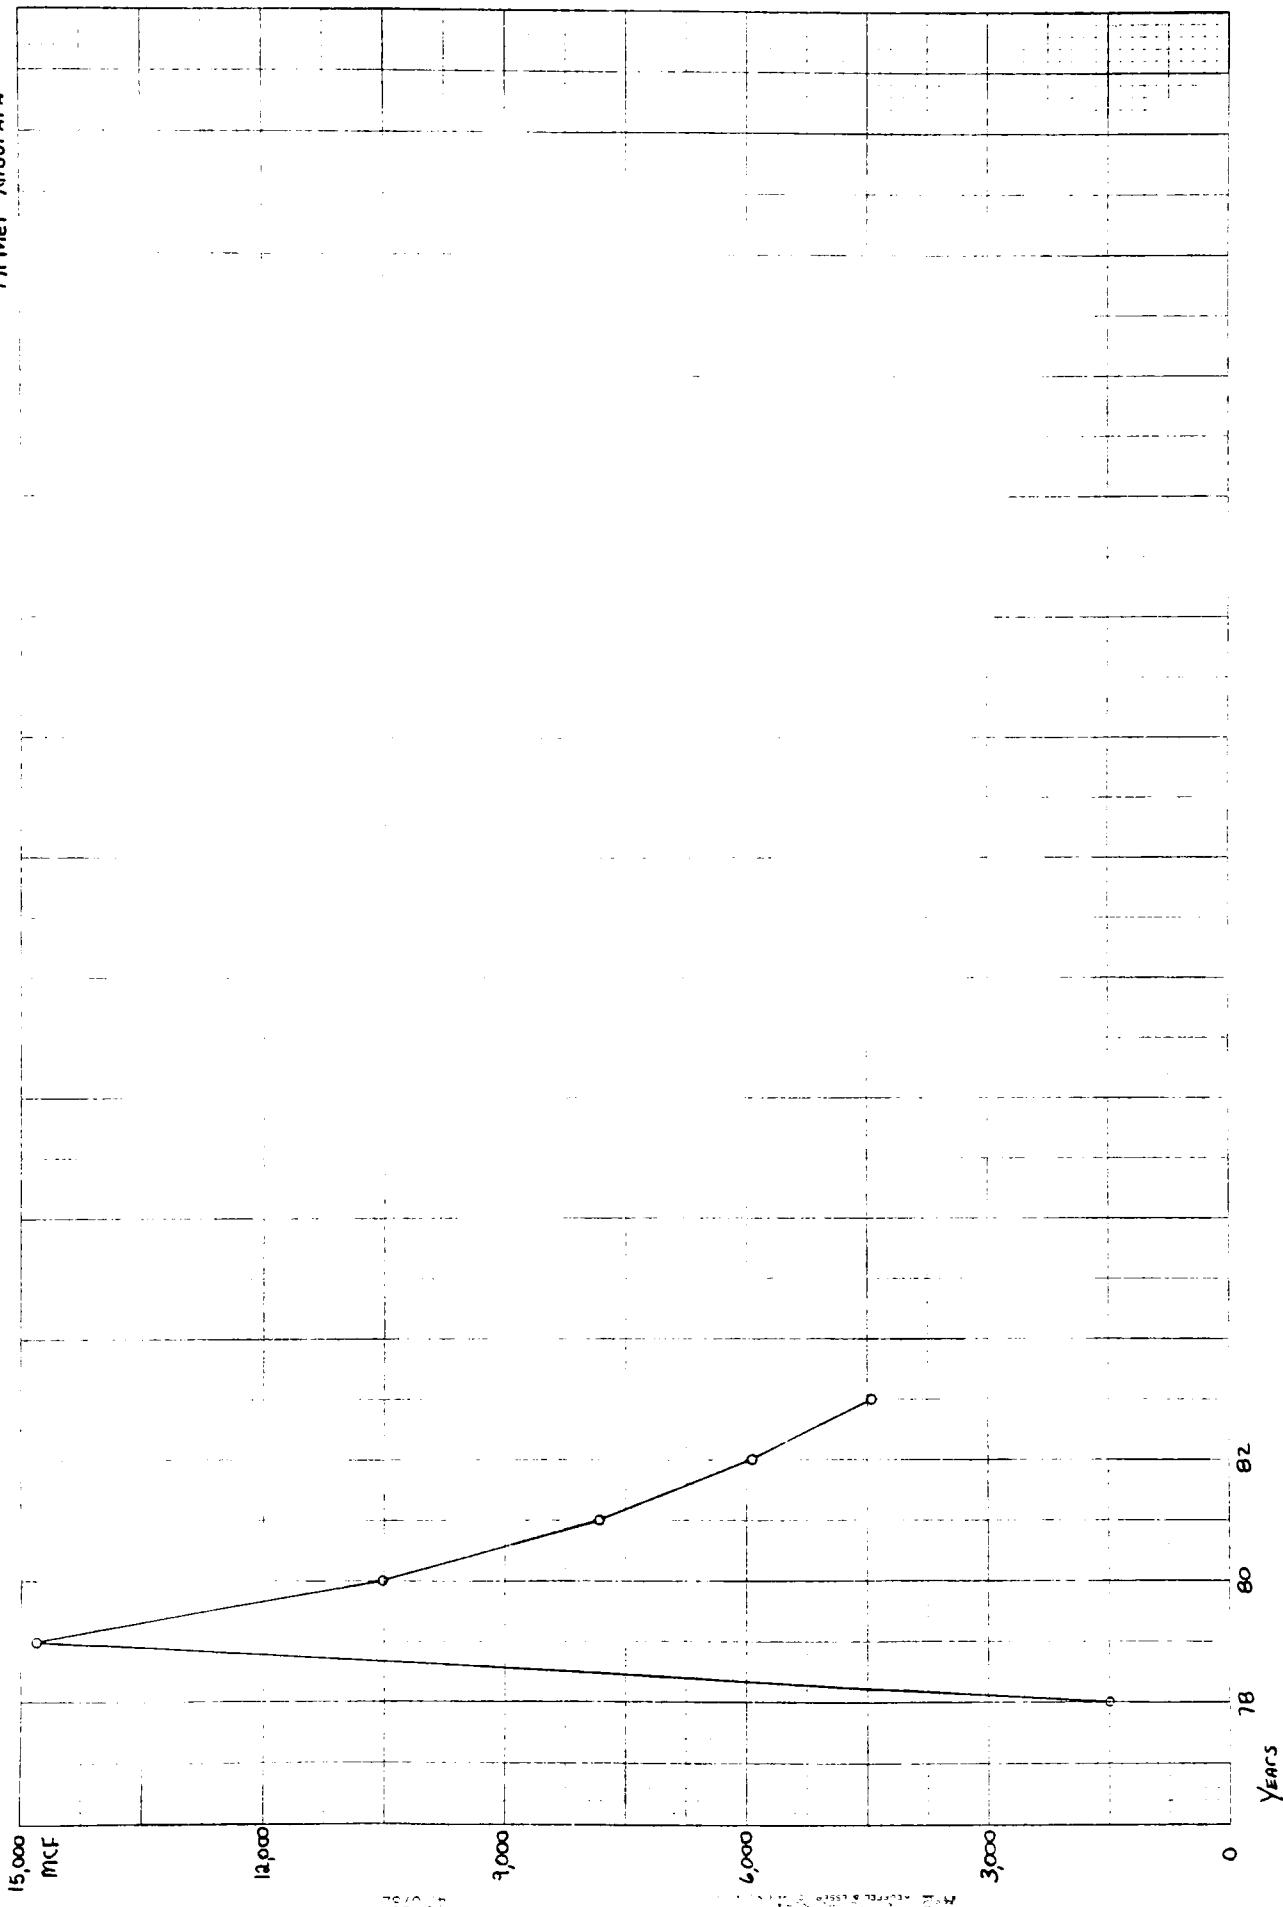

Note that only those fields actively producing as of 12-31-83 are included.
Abandoned fields or field-horizons are not included.
